TESTING & QUALITY CONTROL

BGA uses OE (Original Equipment) parameters and tolerances as the mandatory MINIMUM requirements to pass our quality controls – meaning that our components can and will often surpass OE.

TENSIONER SPRING RATE TEST

This test evaluates the core element of the tensioner [the spring] as the spring is responsible for more than 90%+ of the applied tension of the chain. Performance specification is critical.

GUIDE SIZING

Utilizing a CMM machine to evaluate Guide sizing against OE, guarantees original specification alignment and fitment.

TENSILE TESTING OF CHAINS

To meet the design criteria, parts are subjected to control pulling force with a range of difference parameters measured, presented as a line graph showing elongation, yield point, maximum operating load and maximum load.

VVT FUNCTION TESTING

ENSURING BGA VVT SPORCKETS OUTPERFORM THE ORIGINAL.

The VVT is mounted in a bespoke fixture which enables real world evaluation of torque performance, which is critical to its operation within the engine valve train.
